

→ Pip install pandas

* Series S capital *

import pandas as pd

marks = pd.Series([10, 20, 30, 40, 50])

print(marks)

// 0 10

1 20

2 30

3 40

4 50

dtype: int64

data = {"name": ["john", "david", "sara"],

"age": [25, 30, 35]

"city": ["chennai", "mumbai", "delhi"]}

df = pd.DataFrame(data)

print(df)

	name	age	city
0	john	25	chennai
1	david	30	mumbai
2	sara	35	delhi

df.head → First 5 rows

df.tail → Last 5 rows

df.shape

↳ Give the number of rows and columns.

df.dtypes - Datatypes of the columns

df.describe - Gives the statistical data

df.sample - Sample one row from the data

df.info - Gives information about the dataset

~~df.loc~~ - ~~Get~~

In filtering concept

`df[df["Age"] > 25]`

→ using multiple conditions

`df[(df["age"] > 25) & (df["salary"] > 30000)]`

→ `df.loc[0]`

Index based selection

→ for specific rows and columns

`df.loc[0:5, ["Name", "Age"]]`

→ `df.iloc[0]`

→ position based selection

→ `df.iloc[0:5, 0:2]`

→ first 5 rows + first 2 columns

→ `df.isnull()` → checks for missing values

→ `df.dropna()` → removes the rows which have missing values

→ `df.fillna()` → replaces the missing values

for Renaming columns → `df.rename(columns = {"Name": "Student-Name"})`

to apply function for each value / row

`df["Age"] = df["Age"].apply(lambda x: x+1)`
